

Dictyopanus pusillus

Dictyopanus pusillus © Fran Guard

Pileus: weakly convex, round to kidney-shaped; 2 – 5 mm diameter; smooth but appears velvety under a lens; cream, pale fawn to buff.

Stem: lateral, reduced; 1 – 8 × 0.5 - 1 mm; minutely velvety; pale fawn.

Pores: about 3 per mm; usually round but may be radially elongated towards the stem.

Spore print: white.

Spores: ellipsoid; 4 – 5.5 × 2 – 3 µm; smooth, hyaline.

Substrate: wood, including wooden outdoor furniture.

Habitat: forests and woodlands.

Notes: this pored fungus is easily recognised by its small size, shape, attachment and colour. This species is also known as *Panellus pusillus*.

Collections examined: AQ796234, Dilkusha, Maleny, Fran Guard, 3 Mar 2002.
