

Amaurodon viridis

Amaurodon viridis © Pat Leonard

Fruiting body: resupinate on the underside of small logs. Surface covered with small raised bumps.

Substrate: small logs.

Habitat: rainforest with Eucalypts.

Notes: very uncertain identification based on image and brief description in Tasmanian fungi. Cunningham says this species is yellowish green rather than blue!

Collections examined: BT36, Clark's Farm, Bellthorpe, Ix Nguyen, 16 Mar 2014.
