Cheimonophyllum candidissimum

Cap: convex, laterally attached; to 20 mm diameter, < 5 mm tall; glabrous, viscid; hyaline white.
Stipe: absent.
Gills: hyaline white; about 10 stretch from the margin of the cap to a common point of attachment; lamellulae intercalated in two series.
Flesh: thin, white hyaline; unchanging on exposure to air.
Spore print: white.
Spores: subglobose; 6.5 – 7.5 × 5.5 – 6.5 µm; inamyloid; with a long apiculus making the spores appear almost lacrymoid.
Basidia: clavate; mostly two spored but 1-spored and 3-spored basidia also present; 30 – 40 × 5 – 7 µm.
Pleurocystidia: absent, or at least not distinct.
Pileipellis: a fairly simple trichoderm.
Habitat: in troops on well rotting wood.
Notes: this appears to be the species illustrated in Fuhrer, and described by Singer.
